

THE AIR SHUTTLE

Icam's air shuttle module has been developed to be used either as an addition to the pneumatic book handling system, or as a stand alone unit without the use of a top glass. The pneumatic shuttle moves large documents for single page filming and can be linked to the exposure system so that a single foot pedal press will capture a frame then move the document into position for the next shot. Operator fatigue is reduced due to automatic movement and the "fail safe" design of the air system provides a totally safe working environment for the operator and the documents. The air shuttle can be specified in various sizes to suit a wide range of documents.
